## 2 Introduction

This org-mode file contains a program, UPROP, that can be used to preform calculations that propagate uncertainty using the standard Gaussian model. Values are represented as complex numbers with the imaginary part being the standard deviation. i.e. V+iU means the value is V and the uncertainty is represented by U (a standard deviation).

#### 3 Menu

### 3.1 Notes

### 3.1.1 [SHIFT] key magic for menus

Menu keys that can accept a value with uncertainty in the X position of the stack behave differently when used with the [SHIFT] key. If the [SHIFT] key is pressed before such a menu key, then it is like pressing [SHIFT] [COMPLEX] and then the menu key. For example, pressing [SHIFT] [COSH] is the same as [SHIFT] [COMPLEX] [COSH]. This is a handy way to save a keystroke when entering new values.

Note that I+VU doesn't take a value with uncertainty, and thus pressing the [SHIFT] key before this function has no effect.

#### 3.1.2 Global Labels

The menu items correspond to global labels that you can XEQ from other programs. The names are the menu labels prefixed with "U" – so "SIN" becomes "USIN".

#### 3.1.3 UI→VU & UVU→I: Intervals

These functions convert between intervals and quantity with uncertainty. Intervals are specified by interval end points on levels X & Y of the stack. For I-VU the order is not relevant, but  $VU \rightarrow I$  will always return the leftmost end point in Y and the rightmost end point in X.

## 3.1.4 UVU→%

Given a quantity with uncertainty in X, it will return T% of the uncertainty. This value is always positive.

### 3.1.5 UxU: Multiply uncertainty

This is a quick way to multiply the uncertainty by a factor. For example if you are using an expanded uncertainty value.
